### Summary of project

TRIDENT Environmental Group, LLC was selected to provide soils recovery of PCB containing soil in Claremont, NH. A site developer along with a sub contracted excavation contractor removed TSCA regulated PCB impacted soils from one parcel during site development and sold this soil to a local gravel pit. EPA Region 1 identified the issues with the project and demanded the soils be brought back to the site of origin and stockpiled in various cells based on a specified sampling criteria within a specified time frame.

### TRIDENT's role in the project

TRIDENT was hired to excavate the 50,000 CY from the gravel pit and live load dump trucks which were then decontaminated prior to leaving the gravel pit. The trucks then proceeded approximately 2 miles down the road to the site of origin where various cells were constructed to receive the contaminated materials. An access road had to be constructed to allow the on road dump trucks to access the dumping station on the site of origin. Trucks were then decontaminated prior to being allowed to go back to the gravel pit for additional soils. We continued these activities under the oversight of EPA Region 1 until the gravel pit was successfully free of PCB soils.
