### Summary of project

TRIDENT Environmental Group, LLC removed one 20,000 gallon underground storage tank installed within the alleyway between Washington hall and the maintenance/boiler building. The access for excavation was limited and TRIDENT utilized vacuum excavation techniques. Vacuum excavation was selected due to the limited access and the space between the tank and building foundation walls was less than 18 inches. We then mobilized a 200 ton crane and strategically set up to conduct this tank removal. The tank was placed on a low bed trailer and disposed of at a Massachusetts licensed tank disposal yard.
